Overview

This grading scheme evaluates the project work component (Demo Session der Projektarbeit (60%)). The project must demonstrate:

- Practical application of AI concepts (at least one AI model or algorithm used)
- Real-time interactivity or environmental engagement

Projects may be **creative, playful, critical, or real-world focused**. The focus is on **technically sound execution**, difficulty level will be considered as an overall factor.

Guidelines for students:

- **Interactivity is mandatory:** Must involve (near) real-time feedback or environmental interaction (e.g., camera, sensor, user input).
- **Documentation is critical:** A lecturer should be able to reproduce the system in <1 hour.
- **Ethics matter:** all projects must reflect on ethical, legal and social aspects (max. 1 A4 page).
- **Code is not graded**, but should be **clean and readable**. **Documented code helps** to evaluate your thoughts correctly.
- Technical concepts should be clearly communicated.
- **Creativity and real-world relevance are equally valued.**
- **Report** uploaded to mystudy (Including
 - Project Concept/ Motivation,
 - Documentation of AI model / tools used with technical grounding,
 - Ethical & Societal reflection,
 - Each member's contribution,
 - Link to Repository/Code.)

Category	Weight	Key Focus	1 (Excellent)	2 (Good)	3 (Satisfactory)	4 (Sufficient)	5 (Poor)
1. Concept & Creativity / Real-World Relevance	15%	Originality or meaningful application	Highly original idea <i>or</i> meaningful real-world application. AI enhances the experience or impact.	Creative idea <i>or</i> addresses a real need. AI use is necessary.	Functional but not novel <i>and</i> lacks real-world impact or creativity.	Generic or trivial. AI feels tacked on.	No clear concept; AI used randomly.
2. Technical Implementation & Interactivity	25%	Real-time feedback, stability, responsiveness	Real-time processing (<bearable delay). Clear feedback (e.g., sound/light/animation). Stable and responsive.	Works reliably. Interaction present but slightly delayed.	Basic interaction (one trigger → one response). Frequent bugs.	Minimal or no interaction. System crashes often.	No working interaction.
3. AI Model & Technical Grounding	20%	Model choice, explanation, evaluation	Model well-chosen (e.g., lightweight CNN, rule-based). Explains how AI works. Includes accuracy, latency, or metrics.	Model reasonable. Some explanation of how AI works.	Basic model used. Minimal technical detail.	Model choice unclear or inappropriate. No explanation.	No AI model described.
4. System Documentation & Reproducibility	15%	Clear setup, code quality, reproducibility in ~1 hour	Full README.md, requirements.txt, Dockerfile, or setup video. Code modular and well-documented.	Documentation mostly complete. Code understandable. Setup <1 hour.	Missing key steps. Code messy or undocumented. Setup >1 hour.	Incomplete or confusing instructions. System cannot be run.	No documentation; system cannot be run.
5. Ethical & Societal Reflection	10%	Misuse, bias, privacy, mitigation	Identifies realistic misuse (e.g., surveillance). Proposes mitigation (e.g., “no data stored”). Deep ethical awareness.	Identifies one or two misuse risks. Suggests basic mitigation.	Mentions misuse but lacks depth. Minimal mitigation.	Superficial or generic discussion.	No ethical reflection.
6. Presentation & Communication	15%	Clarity, confidence, audience awareness	Confident, structured, engaging. Answers questions thoughtfully. Visuals enhance understanding.	Clear but slightly rushed. Answers most questions.	Unclear or disorganized. Struggles with in-depth questions.	Poor delivery. Struggles with basic questions.	No presentation or disorganized.

Example project ideas:

Project	Type	Key AI Component	Interactivity	Difficulty Level
Color Symphony	Creative	Color detection (OpenCV)	Sound based on clothing color	
Smart Plant Watering Assistant	Real-World	Binary classifier (ML)	LED + dashboard	
AI Shadow Puppet Theater	Creative	Hand shape detection	Animated shadows	
Accessibility: Voice-Controlled Light Switch	Real-World	Speech recognition	Voice → light control based on time of the day and other context
